
Auto Cropping for Multiple Originals

When scanning from the scanner glass, you can scan multiple originals at once without having to scan them one by one. They are automatically cropped into separate images and saved.

This feature supports not only standard-sized originals but also irregularly shaped items such as receipts, invoices, and photos of various sizes.

Capable of Scanning Various Types of Originals

Two methods are available for scanning various types of originals: the ADF (Automatic Document Feeder) and the scanner glass.

- ☐ ADF: Suitable for scanning large volumes of originals or long paper.
- ☐ Scanner glass: Suitable for delicate documents, photos, ID cards, booklets, and other items that cannot be scanned using the ADF.

You can also perform continuous scanning by combining the ADF and the scanner glass. The auto size detection feature saves originals as a single file at the appropriate size, allowing you to efficiently select the optimal scanning method for each original.

Paper Protection to Reduce Damage to the Originals

This scanner comes with a paper protection feature. If the sensor detects an error, such as when scanning a document in the ADF that has been stapled, it will stop scanning to prevent damage to the document that could be caused by a paper jam.

Notification of Dirt on the ADF

This scanner can detect dirt on the glass surface of the ADF (the scanning sensor), and notify you that you need to clean the glass surface before dirt can cause lines (streaks) in the scanned images.

You can easily keep the glass surface clean, and avoid a decline in image quality.

This feature is off by default.
